Getting AI and Automation right for what comes next

Where we are right now – What have we learnt during Covid

COVID-19 highlighted the importance of digital technologies – including data and AI

December 2020 techUK released “Respond, Adapt, Recover – Stories of how tech is delivering on the frontline”

- Healthtech and social care
- The digital transformation of communities
- Working from home - securing new ways of working
- Data’s role across the healthcare response

Respond - Remote patient monitoring, community alarms, sensors in the home – all cases of automation

Adapt – Drug discovery – research from months to 48 hours, use of data for operational needs

Recover – Second wave of the virus -drug discovery, vaccine development, contact tracing, outbreak prediction, treatment and diagnosis

FOR WHAT COMES NEXT

Respond,
Adapt,
Recover

Stories of how tech is
delivering on the frontline

Looking to the future – Opportunities ahead in health

- **Reducing the size of the elective backlog**
- One of the most pressing challenges facing the NHS, along with workforce shortages; automation can help with both and play an extremely important role in accelerating recovery
- Automation is already making a significant impact in hospitals across the country, helping to improve outcomes for patients
- A survey carried out last year by NHSX found that 65% of respondents who were implementing RPA identified the following as their top priorities:
 - increased productivity;
 - increased clinical efficiency;
 - improved process integration;
 - and a focus on continuous improvement
- We believe the NHS is still at an early stage of RPA adoption but know that many organisations have plans to expand RPA development over the coming years

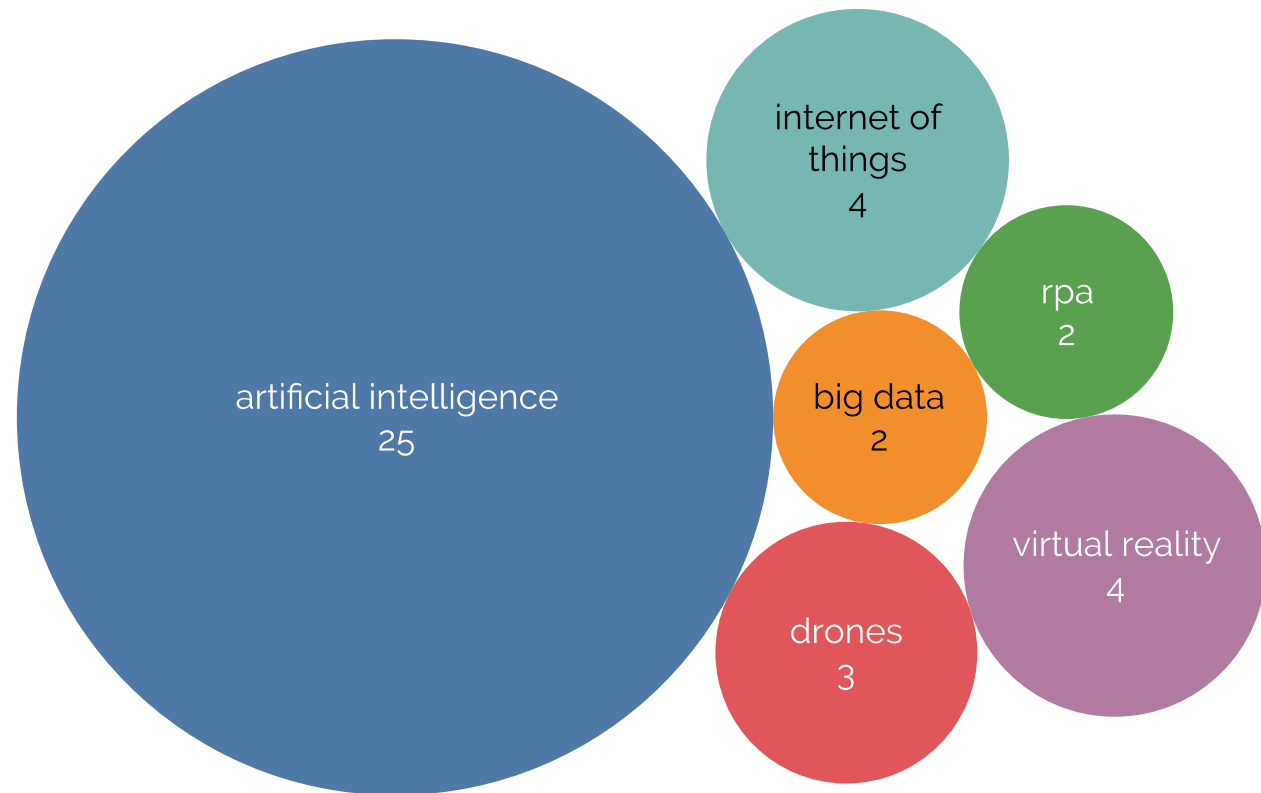

Volume of contracts for “future tech” increased again in 2019, with AI being the most widely adopted

Number of future tech contracts awarded by Central Government since 2016

Future tech contracts awarded by Central Government in 2019

Industry Perspective: Intelligent Automation in Central Government

Core barriers to public sector adoption of IA

- A lack of skills
- A lack of strategic approach
- The need for a cultural shift in workplace
- Funding
- The do-it-yourself-approach does not always work

Whilst this is specifically government, they also apply across different industries and sectors

Recommendation 1: Undertake deeper engagement and collaboration between Government and industry through a specific Intelligent Automation forum, - shine a light on the possible.

Recommendation 2: Knowledge-sharing tools and platforms such as the Government's Automation Register should be **more visible and accessible**

Recommendation 3: Appoint a strategic sponsor within each Government Department's leadership team. Convene a forum of these sponsors to develop conversations based around strategic value, rather than technical problems.

Recommendation 4: Engage industry to support the consolidation of the Department **Automation Blueprints** to create a coherent, integrated and well-scoped programme of activity.

Recommendation 5: Leadership must establish and reinforce the expectation that **automation will augment the workforce**, enabling employees to spend more time on strategic initiatives instead of mundane tasks.

Recommendation 6: Ensure appropriate funding is place in the next Spending Review to support the adoption and scaling of automation.

Thank you
